NETFLIX DATA ANALYSIS

Project Summary | MySQL

Objective
Use SQL to explore Netflix movies and TV shows, identify catalogue patterns, and compare ratings, genres, release periods, runtime, and cast/crew participation.

1. Dataset

Table	Fields / purpose
Titles	Title ID, title, type, description, release year, age certification, runtime, genres, production countries, seasons, IMDb ID, IMDb score, IMDb votes, TMDB popularity, and TMDB votes.
Credits	The uploaded CSV contains the fields: person_id, id, name, character, role. These link people and their roles/characters to titles using the title ID.

2. Workflow

- Create the MySQL database and tables, then import the titles and credits CSV files.
- Clean missing or blank values, trim unwanted whitespace and characters, and convert numerical fields to appropriate numeric types.
- Use SQL queries to summarize and compare the catalogue.

3. Key Analysis Areas

- **Ratings:** highest- and lowest-rated movies/shows; average IMDb and TMDB scores by type, country, and age certification.
- **Catalogue trends:** titles by release year and decade, average runtime, most-seasons shows, common genres, and age certifications.
- **People and credits:** most frequently credited actors and directors, people associated with highly rated titles, and recurring character credits.
- **Title-level comparisons:** directors of movies released from 2010 onward and movies combining high IMDb scores with high TMDB popularity.

4. SQL Concepts Used

Database/table creation, CSV import, data cleaning, ALTER TABLE, NULL handling, filtering, sorting, GROUP BY, aggregate functions (COUNT/AVG/SUM), joins, HAVING, DISTINCT, UNION ALL, and LIMIT.

5. Outcome

The project builds a SQL-based workflow for exploring Netflix catalogue data and producing ranked lists, aggregated statistics, and cast/crew comparisons. These results can help describe patterns in content, ratings, and production credits.

6. Final Validation

Before submission, verify that database/table names in the analysis queries match the created schema, that the credits character column is referenced consistently, and that content-type/role labels match the data. Also review the handling of missing IMDb votes and the AND/OR conditions in the leading-role query.

Scope: This summary reflects the supplied SQL script, the uploaded credits CSV header, and the provided description of the titles dataset. Specific findings are not stated because query result outputs were not provided.
